Microservice Architecture

Monolithic Architecture

Docker compose

- Compose is a tool for defining and running multicontainer docker application
- Use YAML file to configure your applications service
- With single command, you create and start all the services from your configuration

Docker compose

Using Compose is basically a three-step process:

- 1) Define your app's environment with a Dockerfile so it can be reproduced anywhere.
- 2) Define the services that make up your app in docker-compose.yml so they can be run together in an isolated environment.
- 3) Run docker-compose up and Compose starts and runs your entire app.

Docker compose Installation

open google --type install docker compose --open docs.docker --
open/select linux --copy

command to download the latest version of docker compose :

```
curl -L https://github.com/docker/compose/releases/download/1.29.2/docker-compose-$(uname -s)-$(uname -m)
```

copy and paste in system

Again copy executable permission to the binary

```
#chmod +x /usr/local/bin/docker-compose
```

```
#ln -s /usr/local/bin/docker-compose /usr/bin/docker-compose
```

```
#docker-compose --version
```

Creating Wordpress container with SQL DB --Steps

```
#mkdir compose
```

```
# docker pull mysql:5.7
```

```
# docker pull wordpress
```

Downloading images is optional. Docker compose finds the image in local system, if not available then pull it from dockerhub repository

```
# cd compose
```

```
# nano wordpress.yml
```
